Tech Fest Event Registration

Lab Information

- Use only HTML, CSS and plain JavaScript. No frameworks or libraries.

Scenario

The CSE Club is hosting **Tech Fest 2026**, and students register online for events such as Programming Contest, Web Design or Quiz. The fee is **150 Taka per event**, and each student may join **at most 3 events**.

Build a two-page web app: a **Registration page** and a **Confirmation page**. Create five files in one folder: `index.html`, `script.js`, `confirm.html`, `confirm.js` and `style.css`.

Tasks

Task A: Registration page (3 marks)

In `index.html`, create a heading **Tech Fest 2026 Registration**, a Student Name text box (`id="studentName"`), an Event Name text box (`id="event"`) with an **Add Event** button, and a **Confirm Registration** button. Link `style.css` and `script.js`.

Task B: Styling (2 marks)

In `style.css`, give `body` an Arial font and a 20px margin, give `h1` a color of your choice, and give `button` 8px 15px padding. Link this file from both pages.

Task C: Adding events (5 marks)

In `script.js`, declare an empty global array `events`. Write `addEvent()` so that it:

1. Alerts **"Please enter an event name."** and stops if the box is empty.
2. Alerts **"You can join a maximum of 3 events."** and stops if the array already holds 3 events.

2. Alerts **"You can join a maximum of 3 events."** and stops if the array already holds 3 events.
3. Otherwise pushes the event into the array, clears the box and alerts **"Event Added"**.

ask D: Confirming registration (5 marks)

rite `confirmRegistration()` so that it:

1. Alerts a suitable message and stops if the name is empty or no event has been added.
2. Saves the name with `localStorage.setItem()` and the `events` array with `JSON.stringify()`.
3. Opens `confirm.html` using `window.location.href`.

ask E: Confirmation page (5 marks)

`confirm.html`, add the heading **Registration Confirmed**, a `div` with `id="summary"` and a **Back** utton. Link `style.css` and `confirm.js`.

`confirm.js`:

1. Read the name with `localStorage.getItem()` and the events with `JSON.parse()`.
2. Use a `for` loop to show the name and each event on its own line inside `#summary`.
3. Show **Total Fee = number of events × 150 Taka**.
4. Write `goBack()` to return to `index.html`.

4. Write `goBack()` to return to `index.html`.

Sample Run

1. Click **Add Event** with an empty box → alert: *Please enter an event name.*
2. Add Programming Contest, Web Design and Quiz → *Event Added* three times. A fourth event → *You can join a maximum of 3 events.*
3. Enter the name **Rahim Uddin** and click **Confirm Registration** → the confirmation page shows:

```
Registration Confirmed
Name: Rahim Uddin
Events:
Programming Contest
Web Design
Quiz
Total Fee: 450 Taka
```
